Writing a two-sided argument essay

**Topic: Climate Change** [example]

**Argument:** Is Climate Change a result of human activities?
**Type:** Academic [7 sources]
**Level:** **** [B2/C1]

**Lesson Aim**

To develop the students’ ability to generate main ideas with support and write a two-sided argument essay.

3 types of lesson (writing x2 / reading x1).

1. **Writing**

   - Ask Students to discuss question: Is Climate Change a result of human activities?
   - Write down the arguments in favour and in opposition.
   - Feed in / check key vocabulary (see next page).

   **Free Writing #1:**
   1. Distribute outline #1 (blank).
   2. Students complete outline using ideas discussed previously.
   3. Students write the essay using the completed outline.
   4. Students compare their essay with the model essay.
   5. Extra: Reading Exercise.

   **Guided Writing #2:**
   1. Distribute outline#2 (completed with points).
   2. Students write the essay using outline.
   3. Students compare their essay with the model essay.

   **Marking student’s work:**
   Use marking code: [www.academic-englishuk.com/error-correction](http://www.academic-englishuk.com/error-correction)

2. **Reading**

   1. Distribute text and outline #3 (blank).
   2. Students read the essay and complete outline with key points and support.

Is Climate Change a result of human activities?

C. Wilson (2017)

Temperatures on earth have increased in the early 20th century. Over this time period, atmospheric levels of greenhouse gases such as carbon dioxide (CO2) and notably increased. Many direct result of human activities, while sceptics claim that these gas and temperature increases are a . This essay will investigate both sides of will conclude that the causes of climate change action is needed to reduce emissions.

There is an overwhelming consensus that human activity is responsible for climate change. The first main argument is that there within the academic community and research that supports the notion that climate change is human induced. One is the 2013 Cook Review studies on climate change which found (0.7%) explicitly rejected the position that humans are responsible for global warming (Cook et al, 2012). The second argument, again closely , is that the faster than the natural climate change. Mann et al (2008) found that through comparing data from tree rings, over the past temperature records, the rise over the preceding decade had occurred at a rate faster than any warming period over , the Arctic Sea unprecedented rate of 13.9% per decade with predictions that it will have melted by 2020 (Stroeve et al, 2007). The final argument which cause by humans. Recent ice-core research has revealed that gases CO2, CH4 and NO2 started to increase of the industrial revolution and since then atmospheric levels have increased from 220ppm to ). Overall, there seems to be that climate change has been caused by human activities.

There are a number of views that try to that climate change is human made. The first of these is against the published research. Some scientists disagree (discussed in previous paragraph) due to the studies gave no position in support or against (Tol, 2016). In fact, a Berkley University survey found believe by an equal combination of humans and the environment. A second point is that the climate and cooled are within natural temperature fluctuations. Soon and Baliunas (2003) claim that “many records was probably not the warmest nor a uniquely extreme climatic period of the last millennium.” Furthermore, a later study (ibid) similar in the twentieth century before 1990 occurred around AD 1000 to 1100” in the Northern Hemisphere. The research into climate change models, which are inadequate and inaccurate. According to Lewis and Curry (2014), a comparison between concluded that “the models are exaggerating climate sensitivity” and overestimate how fast the earth will warm . In sum, there and conclusions drawn.
In conclusion, the debate of result of controversial. There is significant scientific evidence that many scientists agree, and changes in closely to . On the other side, this scientific evidence is questioned and the Earth has been through in the past. However, increase in global warming gases and a rise in temperatures is overwhelmingly credible and is caused from scientific evidence, it seems obvious that the rise of industries, the aviation industry and urbanisation more than in the past. Overall, and societies need to take international action now.

YES

1. Over-whelming academic consensus
   • Climate change is human induced.
   • The 2013 Cook review of 11,944 peer-reviewed studies on climate change found that only 78 studies (0.7%) explicitly rejected.
